Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

usptopatentmail@cantorcolburn.com

Office Action Summary

Application No.

10/756,939

Applicant(s)

PARK, JIN-HO

Examiner

WILLIAM L. BODDIE

Art Unit

2629

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 09 August 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 and 14-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 and 14-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/GS-08)
Paper No(s)/Mail Date 8/31/10

- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. In a response dated, August 9th, 2010, the Applicant amended claims 1 and 7. Currently claims 1-11, 14-17 are pending.

Response to Arguments

2. Applicant's arguments with respect to claims 1-11, and 14-17 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-2, 4-6 and 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Katagawa (US 7,079,105) in view of Nakamura et al. (US 7,136,058).

With respect to claim 1, Katagawa discloses, an LCD apparatus comprising:
an LCD panel (fig. 10) displaying images (col. 12, lines 44-46) and including:
a first substrate (14 in fig. 1);
a second substrate facing the first substrate (1 in figs. 1 and 10), a plurality of pixels being provided on the second substrate (fig. 1; col. 4, lines 45-64);
a common electrode disposed on the first substrate (col. 5, lines 8-12);
gate lines (2 in figs. 1 and 10) disposed on the second substrate and opposing the common electrode (col. 4, lines 53-55; fig. 1), the gate lines receiving a gate driving signal (Gn in fig. 11, for example);

data lines for supplying image data signals to the pixels (4 in figs. 1 and 10); and
an output instruction signal line (70 in fig. 10) disposed on the second substrate
(fig. 10) transmitting an output instruction signal;

a data driver (16-1-n in fig. 10) disposed on a data tape carrier package (TCP)
(col. 5, lines 20-28);

a gate driver (18-1-n in fig. 10) outputting a gate driving signal to the LCD panel;
and

a timing controller (20 in fig. 10) providing a first control signal (26 in fig. 10) to
the gate driver so as to control an output of the gate driving signal and providing the
output instruction signal (col. 11, lines 49-51) to the data driver via the output instruction
signal line (70 in fig. 10) to delay the output instruction signal depending on a capacitive
load (col. 11, lines 1-4) and depending on a resistive load formed by the output
instruction signal line (col. 11, lines 59-65),

wherein the output instruction signal line is disposed between the data TCP and
the gate lines (fig. 10; col. 11, lines 44-47), and

wherein the data driver outputs a delayed image data signal to the LCD panel as
the output instructions signal is delayed such that a delayed time of the image signal is
substantially equal to a delayed time of the gate driving signal (col. 11, lines 59-65; col.
12, lines 17-42).

Katagawa is silent as to the source of the capacitive load delay on the instruction
signal line.

Katagawa does not expressly disclose that the output instruction signal line is disposed opposite the common electrode.

Nakamura discloses, an LCD apparatus comprising:

a first substrate, and a second substrate facing the first substrate (col. 4, lines 10-19);

a common electrode disposed on the first substrate (col. 4, lines 17-19);
gate lines disposed on the second substrate and opposing the common electrode (col. 4, lines 10-19); and

signal lines (P1 in fig. 14; and C4, C5 wiring in fig. 15) disposed on the second substrate and opposing the common electrode such that the signal lines have a capacitive load (fig. 14-15; the signal lines will inherently have a capacitive load due to being overlapped with the common electrode in a manner identical to the Applicant's invention).

Nakamura and Katagawa are analogous art because they are both from the same field of endeavor, namely LCD driver circuitry.

At the time of the invention it would have been obvious to one of ordinary skill in the art to arrange the output instruction signal line of Katagawa so as to overlap the common electrode as taught by Nakamura.

The motivation for doing so would have been to reduce the frame size of the LCD, resulting in a more portable display (Nakamura; col. 15, lines 42-50).

To further explain, the proposed combination, it is seen as clear that upon locating the output instruction signal line of Katagawa under the common electrode as

taught by Nakamura, this would result in the capacitance between the common electrode and the output instruction signal line being the sole capacitive load delay component.

With respect to claim 2, Nakamura and Katagawa disclose, the LCD apparatus of claim 1 (see above).

Katagawa further discloses, wherein the output instruction signal line is formed on an area adjacent to the data driver (clear from fig. 10).

With respect to claim 4, Nakamura and Katagawa disclose, the LCD apparatus of claim 3 (see above).

Katagawa further discloses, wherein the LCD panel comprises:

the gate lines (2 in fig. 1) receiving the gate driving signal via the gate driver, the gate lines disposed on the LCD panel, extended in a first direction and arranged in a second direction substantially perpendicular to the first direction (fig. 1, for example);
and

a plurality of data lines (4 in fig. 1) receiving the image data via the data driver, the data lines disposed on the LCD panel, extended in the second direction and arranged in the first direction (fig. 1).

With respect to claim 5, Nakamura and Katagawa disclose, the LCD apparatus of claim 4 (see above).

Kawaguchi further discloses, wherein the output instruction signal line is extended in the first direction and is substantially parallel to the gate lines (fig. 10).

With respect to claim 6, Nakamura and Katagawa disclose, the LCD apparatus of claim 4 (see above).

Katagawa further discloses, wherein the LCD panel comprises a plurality of pixel areas defined by the gate and data lines (fig. 1), and the gate driving signal is provided to a corresponding pixel area at a same time as that of the image data provided to the corresponding pixel area (figs. 7-9, 11-12; col. 12, lines 30-36).

With respect to claim 15, Nakamura and Katagawa disclose the LCD apparatus of claim 1 (see above).

Katagawa, when combined with Nakamura, further discloses wherein capacitive and resistive loads of the gate lines and the output instruction signal line are substantially equal to each other (Katagawa; col. 12, lines 25-36, col. 11, lines 59-65).

With respect to claim 16, Nakamura and Katagawa disclose the LCD apparatus of claim 1 (see above).

Katagawa, when combined with Nakamura, further discloses wherein a delay of providing the output instruction signal to the data driver is substantially equal to the delay of the gate driving signal (Katagawa; col. 12, lines 25-36, col. 11, lines 59-65).

With respect to claim 17, Nakamura and Katagawa disclose the LCD apparatus of claim 1 (see above).

Katagawa further discloses, wherein a portion of the output signal line is disposed on the data driver (fig. 10; seems clear that a portion of 70 is included in the data driver).

5. Claims 3, 7-11 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Katagawa (US 7,079,105) in view of Nakamura et al. (US 7,136,058) and further in view of Kawaguchi et al. (US 5,592,199).

With respect to claim 3, Nakamura and Katagawa disclose, the LCD apparatus of claim 2 (see above).

Neither Katagawa nor Nakamura expressly disclose a plurality of signal transmission members.

Kawaguchi discloses, a plurality of signal transmission members (246, 248 in fig. 32; for example) electrically connecting the data driver with the LCD panel, wherein an output instruction signal line (231 in fig. 32, for example) receives the output instruction signal from the timing controller via one of the signal transmission members (note the connection of 231 with 242 and 240 in fig. 32).

Kawaguchi, Nakamura and Katagawa are analogous art because they are both from the same field of endeavor, namely LCD driver circuitry.

At the time of the invention it would have been obvious to one of ordinary skill in the art to include the so arranged signal transmission members of Kawaguchi for the output instruction signal line of Nakamura and Katagawa.

The motivation for doing so would have been increase the ruggedness of the display and improve reliability (Kawaguchi; col. 4, lines 6-24).

With respect to claim 7, Katagawa discloses, an LCD apparatus comprising: an LCD panel (fig. 10) displaying images (col. 12, lines 44-46) and including: a first substrate (14 in fig. 1);

a second substrate facing the first substrate (1 in figs. 1 and 10), a plurality of pixels being provided on the second substrate (fig. 1; col. 4, lines 45-64);

a common electrode disposed on the first substrate (col. 5, lines 8-12);

gate lines (2 in figs. 1 and 10) disposed on the second substrate and opposing the common electrode (col. 4, lines 53-55; fig. 1), the gate lines receiving a gate driving signal (G_n in fig. 11, for example);

data lines for supplying image data signals to the pixels (4 in figs. 1 and 10); and

an output instruction signal line (70 in fig. 10) disposed on the second substrate (fig. 10) transmitting an output instruction signal;

a data driver (16-1-n in fig. 10) disposed on a data tape carrier package (TCP) (col. 5, lines 20-28);

a gate driver (18-1-n in fig. 10) outputting a gate driving signal to the LCD panel; and

a timing controller (20 in fig. 10) providing a first control signal (26 in fig. 10) to the gate driver so as to control an output of the gate driving signal and providing the output instruction signal (col. 11, lines 49-51) to the data driver via the output instruction signal line (70 in fig. 10) to delay the output instruction signal depending on a capacitive load (col. 11, lines 1-4) and depending on a resistive load formed by the output instruction signal line (col. 11, lines 59-65),

wherein the output instruction signal line is disposed between the data TCP and the gate lines (fig. 10; col. 11, lines 44-47), and

wherein the data driver outputs a delayed image data signal to the LCD panel as the output instructions signal is delayed such that a delayed time of the image signal is substantially equal to a delayed time of the gate driving signal (col. 11, lines 59-65; col. 12, lines 17-42).

Katagawa is silent as to the source of the capacitive load delay on the instruction signal line.

Katagawa does not expressly disclose that the output instruction signal line is disposed opposite the common electrode.

Nakamura discloses, an LCD apparatus comprising:

a first substrate, and a second substrate facing the first substrate (col. 4, lines 10-19);

a common electrode disposed on the first substrate (col. 4, lines 17-19);
gate lines disposed on the second substrate and opposing the common electrode (col. 4, lines 10-19); and

signal lines (P1 in fig. 14; and C4, C5 wiring in fig. 15) disposed on the second substrate and opposing the common electrode such that the signal lines have a capacitive load (fig. 14-15; the signal lines will inherently have a capacitive load due to being overlapped with the common electrode in a manner identical to the Applicant's invention).

Nakamura and Katagawa are analogous art because they are both from the same field of endeavor, namely LCD driver circuitry.

At the time of the invention it would have been obvious to one of ordinary skill in the art to arrange the output instruction signal line of Katagawa so as to overlap the common electrode as taught by Nakamura.

The motivation for doing so would have been to reduce the frame size of the LCD, resulting in a more portable display (Nakamura; col. 15, lines 42-50).

To further explain, the proposed combination, it is seen as clear that upon locating the output instruction signal line of Katagawa under the common electrode as taught by Nakamura, this would result in the capacitance between the common electrode and the output instruction signal line being the sole capacitive load delay component.

Neither Katagawa nor Nakamura expressly disclose a plurality of signal transmission members.

Kawaguchi discloses, a plurality of signal transmission members (246, 248 in fig. 32; for example) electrically connecting the data driver with the LCD panel, wherein an output instruction signal line (231 in fig. 32, for example) provides the output instruction signal to the data driver via one of the signal transmission members (note the connection of 231 with 242 and 240 in fig. 32).

Kawaguchi, Nakamura and Katagawa are analogous art because they are both from the same field of endeavor, namely LCD driver circuitry.

At the time of the invention it would have been obvious to one of ordinary skill in the art to include the so arranged signal transmission members of Kawaguchi for the output instruction signal line of Nakamura and Katagawa.

The motivation for doing so would have been increase the ruggedness of the display and improve reliability (Kawaguchi; col. 4, lines 6-24).

With respect to claim 8, Katagawa, Nakamura and Kawaguchi disclose, the LCD apparatus of claim 7 (see above).

Katagawa further discloses, wherein the LCD panel comprises:

the gate lines (2 in fig. 1) receiving the gate driving signal via the gate driver, the gate lines disposed on the LCD panel, extended in a first direction and arranged in a second direction substantially perpendicular to the first direction (fig. 1, for example); and

a plurality of data lines (4 in fig. 1) receiving the image data via the data driver, the data lines disposed on the LCD panel, extended in the second direction and arranged in the first direction (fig. 1).

With respect to claim 9, Katagawa, Nakamura and Kawaguchi disclose, the LCD apparatus of claim 8 (see above).

Kawaguchi further discloses, wherein the output instruction signal line is extended in the first direction and is substantially parallel to the gate lines (fig. 10).

With respect to claim 10, Katagawa, Nakamura and Kawaguchi disclose, the LCD apparatus of claim 9 (see above).

Katagawa further discloses, wherein the LCD panel comprises a plurality of pixel areas defined by the gate and data lines (fig. 1), and the gate driving signal is provided to a corresponding pixel area at a same time as that of the image data provided to the corresponding pixel area (figs. 7-9, 11-12; col. 12, lines 30-36).

With respect to claim 11, Katagawa, Nakamura and Kawaguchi disclose, the LCD apparatus of claim 7 (see above).

Katagawa further discloses, wherein the output instruction signal line is formed on an area adjacent to the data driver (clear from fig. 10).

With respect to claim 14, McCartney, Nakamura and Kawaguchi disclose, the LCD apparatus of claim 1 (see above).

Kawaguchi discloses, a plurality of signal transmission members (246, 248 in fig. 32; for example) electrically connecting the data driver with the LCD panel,

wherein an output instruction signal line (231 in fig. 32, for example) receives the output instruction signal from the timing controller via one of the signal transmission members (note the connection of 231 with 242 and 240 in fig. 32).

Kawaguchi, Nakamura and Katagawa are analogous art because they are both from the same field of endeavor, namely LCD driver circuitry.

At the time of the invention it would have been obvious to one of ordinary skill in the art to include the so arranged signal transmission members of Kawaguchi for the output instruction signal line of Nakamura and Katagawa.

The motivation for doing so would have been increase the ruggedness of the display and improve reliability (Kawaguchi; col. 4, lines 6-24).

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Nakajima (US 6,587,089) discloses an output instruction signal

line that is located alongside the gate lines to ensure that the output instruction signal line is delayed as much as the gate line signals.

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **WILLIAM L. BODDIE** whose telephone number is (571)272-0666. The examiner can normally be reached on Monday through Friday, 7:30 - 4:30 EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Sumati Lefkowitz can be reached on (571) 272-3638. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
